

ABSTRACT

1 Using a joint video and still image pipeline technology, a network may be
2 deployed through the Internet so that a user may acquire a remote high resolution
3 photograph using a low resolution video streamed from a remote camera as a view-finder.
4 The remote camera may enable the user to exercise control from a remote device through
5 the network or other communication channels. A network server may store the video and
6 the high resolution photograph, and either sends the video and the high resolution
7 photograph to the user upon payment or posts the video and the high resolution
8 photograph on a web page.
